Interlock Control System

For the Access Control to e.g. Clean Rooms or Laboratories

In clean rooms, laboratories, hospitals etc. doors may often be opened only when others are closed. The DICTATOR interlock control system facilitates an easy configuration of these relations, without a complex PLC control system. The relations are "programmed" directly by DIP switches. Trained persons not requiring any special programming know-how can modify them on site at any time.

For an easy mounting the components of the newest generation are connected as telephones or networks by cables with RJ45 connectors (exception: ex-proof version). The power pack for the 24 VDC supply is provided with a safety plug.

The interlock doors can be unlocked either by pushing the corresponding key on the terminals or free of contact by a transponder, the transponder system having an integrated access control.

There are two exceptions from the plug-in version (here the complete electrical wiring has to be effected by the customer):

- the ex-proof version,
- the SP interlock control system for flush fitted switch boxes or pattresses.

Interlock Control System

DICTATOR Interlock Control System -
General Information

In the DICTATOR interlock control system all doors of the interlock control system are generally locked and are released only temporarily when the operating key of the terminal is pressed. This offers the highest possible safety within the interlock system.

Every door is controlled by a separate control board. With the peripheral system these are integrated in the control terminal of the respective door, with the central system the control boards of all doors forming part of the system are united in a central controller. The ex-proof interlock control system is a modified version of the central system.

Unlocking the Doors -
Options

The peripheral system as well as the central one of the DICTATOR interlock control systems offer **two basic options to unlock** the doors:

- Terminals with **key**
  (The peripheral system and the one with central controller RJ use the **piezo-type key** with illuminated ring described in the following. Information on the keys in the ex-proof system and those for the SP switch box system can be found on the pages 08.031.00 and 08.040.00.)
- **RFID terminals without key operated by transponder** (integrated access control)

Another possibility to unlock the door is to connect an extern switch, e.g. a large surface switch.

The piezo-type key is ideally suited for its use in clean rooms. It features no mechanical moving parts where dirt could settle and it is not subject to mechanical wear. It offers a very long operational life of 20 million operations. It also is very resistant to environmental influences. Its operation requires only a very slight pressure.

### Indication of the door status

The illumination on the terminals clearly signals the user whether the respective door can be used or is locked at the moment **(indication of the door status)**. The terminals of the peripheral and the central system have an illuminated ring around the operating key. The ex-proof terminals have an extra illuminated green/red indicator:

- **Green:** The door is locked but can be opened by pushing the operating key.
- **Red:** The door is locked. It cannot be opened as it is locked by another open door. The illumination of the ring will return to green as soon as the other door is closed again.
DICTATOR Interlock Control System - General Information, cont.

The terminals with piezo-type key and transponder of the peripheral and central interlock control system can be combined at will, also on one door. Both models have the same dimensions.

This allows, if necessary, to equip certain areas of the interlock system with an automatic access control without needing additional devices.

Often certain areas of the interlock system shall be accessible only to a limited group of people. Usually this is controlled by additional access control systems.

DICTATOR now has developed terminals for the interlock system that feature an integrated access control. The piezo-type key is replaced by a RFID system. This allows to change authorizations any time and also to attribute different authorizations within one interlock system.

On both sides of each door different authorizations can be programmed.

Instead of pushing the piezo-type key, the door is unlocked by a transponder. The RFID system has been designed so that it can be operated by off-the-shelf transponder chips. The maximum reading distance between terminal and transponder chip is approx. 3 cm.

Transponder chip requirements

- Frequency: 125 kHz
- Storage: 64 Bit
- Type of chip: EM 4100, EM 4102, EM 4200

E.g. DICTATOR transponder chip WD1 (see also page 08.069.00), part no. 710878

Programming

The receivers in the terminals are programmed by a master chip and a delete chip. These should have a different colour than the normal transponder chips.

To train the transponder chips you firstly hold a delete chip close to the receiver, then the master chip and after this the transponder chips to be trained. With the master chip you can delete the access authorization of individual transponder chips any time.

To administer the issued authorizations you use a PC with a RFID reading device to read the transponder chip identifications.

In case transponder chips which meet the a.m. requirements are already being used in the building, these can directly be read. Then there is no need of extra transponder chips in the interlock control system.

Indication of the door status

The terminals of the transponder series signal the actual status of the door and the reception standby by three different luminous diodes. The function of the green and red LED corresponds to the illuminated ring of the piezo-type keys.

Green: The door is locked but can be opened by transponder.

Red: The door is locked. It cannot be opened as it is locked by another open door. The illumination of the ring will return to green as soon as the other door is closed again.

Blue: The blue LED informs about the recognition of the transponder chips.
"Programming"

One of the main features of the DICTATOR interlock control system is the very easy "programming" of the relations between the doors. No computing skills at all are needed.

All relations are adjusted by DIP switches.

The peripheral version features these DIP switches directly in the control terminals. In the central system they are placed on the circuit boards in the central controller.

The relations between the doors can be adapted any time. It is also easily possible to later enlarge the interlock control system.

More detailed information and a programming example can be found on page 08.009.00.

On the same circuit board (either in the control terminal or in the central controller) you can adjust by a potentiometer the time during which the door will remain unlocked, i.e. the door can be opened after the operating key has been pressed. It is of no importance whether the door is really opened or not. The period to be adjusted depends on whether it is an interlock for people or material.

Emergency-Open Switch

The door terminals of the peripheral and the central interlock control system are available either with just an operating key or with an additional emergency-open switch.

In case of an emergency the door can be unlocked by means of the emergency-open switch even while being locked by the interlock control system. The switch remains locked after having been pressed. In order to reactivate the interlock control system the emergency-open switch has to be unlocked by turning. After a short delay the system is ready to work again.

If necessary, the emergency-open switch can be protected by an extra cover against unauthorised use (cover prepared for a lead seal, see page 08.045.00).

Two different emergency-open functions are possible:
- Local emergency-open (LNA): unlocks only the door of the respective terminal.
- Global emergency-open (GNA): unlocks all doors of the group.
Locking Devices

To lock interlock doors bar magnets, electric strikes etc. can be used. A big choice can be found in the catalogue beginning on page 08.047.00.

But already installed locking devices can also be included in the DICTATOR interlock control system. For this purpose they have to meet the following requirements:
- they dispose of a feedback contact which is closed when the door is closed (if necessary, it can be mounted separately),
- they function with 24 VDC and
- they are locked with current (requirement of the EltVTR).

Access Controls

Access controls can be connected to all terminals of the interlock control system (only exception are the ex-proof ones). There are two options for their functioning:
- entering the access code automatically releases the door.
- in addition to entering the access code the piezo-type key of the terminal has to be pressed.

A choice of access control systems can be found beginning on page 08.067.00. Access control systems that are already installed have to have a potential-free make contact (NO) (switching time about 1 sec.). If possible, the access control system should function with 24 VDC as it then can be fed by the power pack of the interlock control system.

Additional Switches (e.g. Large Surface Switches)

The DICTATOR interlock control system allows also to connect large surface switches or something similar to adapt the interlock control system optimally to the needs of the users. Large surface switches are very convenient when the persons passing through the interlock door have to carry something and therefore don’t have empty hands or when they are handicapped.

Integration of Emergency Exits

Interlock control systems often also include emergency exits. These have to be equipped according to the requirements of the ElivTR (German standard for electrical locking systems on emergency exits).

For this purpose DICTATOR has developed as a special component the emergency exit terminal which has been tested and approved by the TÜV Thüringen. This terminal can easily be integrated in a DICTATOR interlock control system.

Door Operators

Especially in clean rooms interlock control systems form part of a production process. There doors often should open automatically. The DICTATOR interlock control system also easily allows to integrate door operators in the interlock system. The door operator should have the following characteristics:
- automatic closing or a separate control device for a closing command.
- signal output “door closed” (NO). (If not available, a separate feedback contact has to be mounted.)

Time Control

Depending on the type of the DICTATOR interlock control system there are different possibilities to reopen certain doors of the interlock system only after an adjustable period. This can be achieved either directly by some terminals or by an additional time control unit.
**Discretion Circuit**

The interlock control system allows to establish a discretion/delaying circuit for any doors. These doors cannot be opened from the outside even when all other doors are closed, as long as they are locked from the inside by a separate switch (e.g. for undisturbed changing).

**Relay Controlled Additional Functions**

The control terminals of the peripheral system and the control boards of the central system dispose of different signal outputs/status indications. They all can be used for transmission to a facility management system. The peripheral interlock control system allows also for many relay based additional functions. Among these are:
- Starting a ventilation/heating.
- Switching on/off lighting.
- Controlling a pressure compensation.
- Optical/acoustic warning signals.

**Number of Doors in Interlock Systems**

The DICTATOR interlock control system has been designed for smaller interlock systems. Due to its very easy mounting, wiring and "programming" the DICTATOR interlock control system represents an ideal solution to the always increasing requirements regarding hygiene and clean rooms. The number of doors in the interlock control system depends on the type of the interlock control system.

- **Peripheral interlock control system**
  The standard version of the peripheral system has been designed for up to 8 doors. But it also can be used for more doors if the doors can be combined to several groups. At a maximum there can be controlled 8 groups of doors with 8 doors each.

- **Central interlock control system**
  The version with the central controller has been designed for installations with up to 5 doors. But also the central system is flexible and can be extended to up to 8 doors. But this system requires that all connected doors have to be within the reach of a 15 m cable to the central controller.

- **Ex-proof interlock control system**
  The ex-proof system is based on the central control system and therefore also can control only up to 5 doors. Same as the central interlock control system this system can be extended to a maximum of 8 doors. But here the ex-requirements have to be observed.

- **SP interlock control system for flush fitted switch boxes or pattresses**
  The interlock control system for the switch system LS 990 uses the central controller of the ex-proof version which has to be wired on site. The maximum number of doors corresponds to the one of the central system.

Just ask us. We will work out a free of charge offer with a solution proposal.
Interlock Control System - Programming

The following matrix helps you to determine the position of the DIP switches on the control boards. Just mark for each door which other door(s) may be open at the same time and which one(s) must stay locked (see example below).

There are 3 positions for the DIP switches:
Position +: defines the door for which the relations are set (basis door)
Position -: this door is locked as long as the "basis door" is open.
Position 0: this door can be opened even though the "basis door" is open, too.

Clean room interlock system with 5 doors

Peripheral Interlock Control System - Overview

The peripheral DICTATOR interlock control system is the most flexible type of the interlock control systems. Its modular structure offers the possibility to meet an extraordinary number of special requirements.

All intrasystem components are connected by pluggable cables. Except for the alimentation these are flat cables with RJ45 connectors.

The peripheral interlock control system has been designed for up to 8 doors respectively groups of doors of maximum 8 doors each.

Basic Set-up

The basic set-up of the peripheral DICTATOR interlock control system is very simple:

The doors of the interlock system are directly controlled by the control terminals on the doors. The distribution boxes work as junctions between the control terminals. Depending on the number of doors in the interlock system and their spatial arrangement, 1 to max. 4 doors can be connected to a distribution box (see also page 08.015.00). The distribution boxes are connected by pluggable cables, one for the power supply and one as control cable.

The distribution box is connected to each of its respective doors by a pluggable control cable and power cable.

Every door needs a control terminal. In case the door shall be controlled from both sides, an operating terminal has to be mounted on the other side of the door. As this is controlled by the control terminal, it does not need an elaborate circuit board.

The locking element of the door (bar magnet, electric strike etc.) is connected directly to the control terminal.

All control cables, also the one to the locking element, are simple flat cables with RJ45 connectors. If necessary, it is possible to lengthen them by a connector to a maximum length of 15 m.

The system also offers the possibility to integrate the interlock control system in a facility management system, to realise special functions, to output status information etc.

Peripheral Interlock Control System - Components

The peripheral DICTATOR interlock control system consists of a few main components. They are completed by mounting accessories and components for special functions.

The locking elements used have to meet two requirements: A feedback contact that is closed when the door is closed, and to function with 24 VDC quiescent current, i.e. with current they are locked (requirement of the EltVTR = German standard for electrical locking systems on emergency exits).

System Components

Control terminal
Per door there is needed one control terminal. It is the core of the peripheral interlock control system. In the control terminal are determined the relations of this door in reference to the other doors of the interlock system by DIP switches. It can be provided either with a simple operating key or with an additional emergency-open switch.

There are available three versions of the control terminal: Basic, Plus (for additional functions) and as RFID terminal for transponder chip. Further details can be found on the next pages.

Operating terminal
Normally an additional terminal is required for the rear side of the door. This operating terminal comprises corresponding to the used control terminal either only an operating key or the RFID system or also the emergency-open switch. The operating terminal is connected to the control terminal by a flat cable with RJ45 connector.

Connection cable
The connection cables play an essential part in making the DICTATOR interlock control system such an easy to handle system. All control cables and the connection to the locking elements are flat cables with RJ45 connectors. The cables and the corresponding sockets are clearly marked by colours to prevent any faulty connection during installation. In case of need, the cables can easily be lengthened by using simple connectors up to a maximum distance of 15 m between the components.

For the power supply there are available, depending on the required function, 2 core or 6 core cables with connectors on both ends.

Distribution box
The distribution box has been designed for 1 to maximum 4 doors. Both, the control cable and the power cable, are simply clipped to it. In addition it offers space for the relays needed for additional functions.

Central power pack
The 24 VDC power supply of the terminals and the locking units is provided by a central power pack. It is available either with 2.7 A or 5 A power. The power pack is furnished ready for mounting with a mains cable with safety plug and a 2 m long 24 VDC cable with 6-pin connector to one of the distribution boxes of the system, i.e. it doesn’t have to be opened for connection.

Locking elements
For locking the doors there is available a large choice of bar magnets and electric strikes (see page 08.047.00 and the following). It is essential that the used locking devices dispose of a potential-free feedback contact.

Emergency exit terminal for emergency exit doors according to EltVTR
In case of emergency exits in the interlock system, it is easy to integrate them with the help of the tested emergency exit terminal.

Time control unit
If the interlock system includes doors that shall be free only after a certain time (for de-contamination, reaching determined temperatures etc.) and the remaining time should be indicated to the persons in the interlock, the DICTATOR time control unit together with the corresponding secondary indication displays will accomplish this.
Peripheral Interlock Control System - Control Terminal

The control terminal is the central component of the peripheral DICTATOR interlock control system as it contains the control circuit board where the relations between the different doors are set. It is available as a Basic and a Plus version and as RFID terminal for transponder chip, all versions with or without the emergency-open switch. The DICTATOR terminals meet the requirements of clean rooms. As operating button a piezo-type key is used that reacts on very little pressure. Both front plate and key are made of stainless steel.

The front plates of the terminals have been designed for their mounting in hollow profiles. On demand, front plates with differing measurements and with the customer’s logo are available.

**Performance**

**Basic version (with piezo-type key or RFID system)**
- 1 signal output for actuating the emergency-open switch (if included)
- 1 signal output (to be configured by a jumper)

**Plus version (only with piezo-type key)**
- 1 signal output for actuating the emergency-open switch (if included)
- 2 signal outputs (to be configured by jumpers)
- Integrated time control unit without display (adjustable times: 1, 2, 3, 4, 5 minutes. Different times are possible on demand.)

Peripheral Interlock Control System - Operating Terminal

Normally the doors of an interlock system are used from both sides. Therefore, an additional operating terminal (without control board), connected to the control terminal, is required on the rear side of the door. The operating terminal is available only as standard type. The front plates of the terminals have been designed for their mounting in hollow profiles. On demand, front plates with differing measurements and with the customer's logo are available.

Operating terminal BT3
- with emergency-open and operating key
  part no. 710901
  with RFID system for transponder
  part no. 710981

Operating terminal BT3oN
- with operating key, without emergency-open
  part no. 710903
  with RFID system for transponder
  part no. 710983

The operating terminal is connected to the control terminal by the connection cable with RJ45 connector (marked yellow). The cable has to be ordered separately. By default two lengths are available:
- 250 mm (part no. 710936)
- 1000 mm (part no. 710937).

To the operating terminal, same as the control terminal, can directly be connected an access control (already integrated in the operating terminal with RFID system) or also a large surface switch for example.

*IP rating when not built in. The final IP rating depends on the mounting situation.
Peripheral Interlock Control System - Distribution Box

The simple wiring of all the components in the peripheral interlock control system is based on the distribution box(es). If there are several distribution boxes, these are connected with a pluggable control cable and power cable each. The control terminals of the corresponding doors are then connected to the distribution box by also pluggable connection cables.

Number of Required Distribution Boxes

Each distribution box disposes of 4 sockets each for the control and the power cables. These are used to connect the control terminals and, if needed, several distribution boxes.

Example 1: Interlock system with 4 adjoining doors
Here one distribution box is sufficient to connect all doors directly.

Example 2: Interlock system with 8 doors
To the distribution box 1 can be connected 3 doors. The 4th sockets are needed for the connection cables to the 2nd distribution box.
To the 2nd distribution box can be connected 2 doors as 1 socket each is needed for the incoming and one each for the outgoing cables. To the 3rd distribution box there can again be connected 3 doors as only one socket each is needed for the incoming connection cables.

Each distribution box disposes of 4 sockets each for the control and the power cables. These are used to connect the control terminals and, if needed, several distribution boxes.

Function Global Emergency-Open

If required, the function global emergency-open (when pressing one emergency-open switch, all doors are unlocked) is adjusted in the distribution box. To achieve this, there is fitted an additional relay (part no. 710921) with pluggable connection cable in only one distribution box of the interlock control system. It is simply clipped to the standard top hat rail in the distribution box. For the connector of this connection cable the additional socket X6 is reserved.

ATTENTION: When choosing the global emergency-open, the 6 core power cable has to be used!
Peripheral Interlock Control System - Distribution Box, cont.

Generally the distribution boxes are fixed in the suspended ceiling or the conductor rail above the corresponding doors. But they can also be mounted at a central place if the distance to the control terminals is not longer than 15 m.

Additional Adjustable Functions

The X5 terminal strip can be used for special functions. For example, to additionally lock any doors by a "privacy switch" (changing rooms) and to connect an external time control unit with display.

The delivery of the distribution box includes a connector for the X5 terminal strip which facilitates an easy connection of these devices.

Dimensions

The strain relief of the incoming and outgoing cables is achieved by fixing the cables with tie wraps to the two cable support brackets. The cable inlets are sealed dust proof by cellular material.

For fixing 4 borings of Ø 5.4 mm are provided in the casing of the distribution boxes.

Peripheral Interlock Control System - Connection Cables

All components of the peripheral interlock control system are mainly connected by simple flat cables with colour marked RJ45 connectors. Only for the power supply are used 2 or 6 core cables with corresponding connectors, depending on the required additional functions. This significantly reduces the mounting costs and the danger of errors when connecting the single components.

Connection cable control - operating terminal (1)
The connection cable between control and operating terminal is a flat cable with yellow marked RJ45 connectors on both ends. It is available with 250 mm and 1 m length. In case the door is equipped with both, a control and an operating terminal, it always has to be ordered additionally.
But when only a control terminal is mounted on a door there just has to be put a jumper (J1) in the corresponding place on the circuit board.

Control cable (2)
The control cable is used to connect all the distribution boxes as well as to connect the control terminals to their corresponding distribution box. The control cable is also a flat cable with RJ45 connectors. The control cable connectors and the corresponding plug-in positions are marked red.
Standard lengths: 3 m, 5 m and 10 m
By means of a connector (part no. 710943) several cables can be linked up to the maximum total length of 15 m between two components.

Connection of door locking device or door operator (3)
As the DICTATOR interlock control system can be combined with a multitude of locking devices the connection cable for the locking device or door operator is furnished only on one end with a RJ45 connector (blue colour). This is plugged in the control terminal.
On the other end of the cable are 4 free leads which are marked explicitly (2 leads for the feedback contact and 2 leads for the power supply).
Standard lengths: 250 mm, 2 m, 4 m and 15 m.

Power cable (4)
The cable for the power supply is available with 2 or 6 cores. It is used to connect the different distribution boxes as well as to connect the control terminals to the corresponding distribution box.
The 6 core cable has always to be used when a global emergency-open is required, a control terminal of the Plus version is used or special functions shall be realised.
The power cables are provided on both ends with connectors which are simply plugged in the distribution box and the control terminal. For the 2 core cables are used just the plug-in positions that are marked - and +.
Standard lengths: 3 m, 5 m, 10 m and 15 m.

Connection of external components
Additional components as access controls or large surface switches have to be connected to the interlock control system by the customer. The control terminal disposes for their connection of a pluggable 3-pin screw terminal.
**Peripheral Interlock Control System - Order Information**

On this page you will find a summary of the part numbers of all components of the peripheral DICTATOR interlock control system.

  part no. 710943
Interlock Control System with Central Controller - Overview

The interlock control system with central controller RJ has especially been designed for installations with up to 5 doors. It can be extended to 8 doors. The central interlock control system is the ideal solution for small systems where all doors are located close to each other. The maximum cable length between terminal and central controller RJ is 15 m.

The control circuit boards being placed in the control terminals in the peripheral system, here are located in the central controller. The basic version of the central controller RJ provides control boards for 2 doors. If the interlock system consists of more doors, the controller RJ will be supplied with the corresponding number of control boards.

Basic Set-up

In the central interlock control system RJ all terminals and locking devices on the doors are directly connected to the central controller RJ.

On both sides of the doors are mounted operating terminals without controlling function. The operating terminal BTZ which is connected to the central controller RJ only has two RJ45 sockets:
- Green: control cable from the central controller RJ.
- Yellow: connection cable to second operating terminal (BT3) on the rear side of the door.

The second operating terminal is identical to the one of the peripheral system.

The locking device is also directly connected to the central controller RJ. The blue marked cable is plugged in the central controller RJ in the designated RJ45 socket. The other end of the cable has 4 leads of different colours to connect the locking device.

The power is provided by the power pack ready for plug-in. Its safety plug simply has to be plugged in a socket provided on site. In the central controller RJ also a socket for the power cable of the power pack is provided.

All control cables, also the cable to the locking device, are simple flat cables with RJ45 connectors. An additional power cable to the operating terminals as with the peripheral system is not required.

Legend:

Central Interlock Control System - Components

The DICTATOR interlock control system with central controller consists of a few main components. They can be mounted and "programmed" with extremely little effort.

Beside the basic functions many additional requirements can be met by the central controller RJ of the DICTATOR interlock control system. For some standard components can be used, for others an additional LAN module has to be used.

Mounting accessories can be found on page 08.045.00 and the following.

Central controller RJ
Each installation requires one central controller RJ. Usually this can control up to 5 doors. But it is possible to enlarge the system. The following options are available:
- Connection of a second central controller RJ. This allows to enlarge the system to up to 8 doors (4 doors per central controller RJ).
- Connection of a distribution box of the peripheral interlock system (see page 08.015.00). This allows to control 8 doors in total: 5 doors by the central controller RJ and 3 more doors by the distribution box of the peripheral system. Each of these 3 doors needs a control terminal of the peripheral system and if necessary, an operating terminal BT3 - see page 08.013.00 and following.
- Direct connection of an operating terminal BTZ to the installation, i.e. there is added 1 door to the system to make it 6 doors in total.

Operating terminal BTZ
On every door an operating terminal BTZ has to be mounted. It is available either with operating key or with RFID system for transponder chip.

The operating terminal BTZ provides 2 sockets for RJ45 connectors:
- green socket: connection cable to the central controller RJ,
- yellow socket: connection cable to an operating terminal BT3 on the rear side of the door.

Operating terminal BT3
The operating terminal BT3 is also used for the peripheral interlock control system. It completes the operating terminal BTZ on the rear side of the door. The only difference is that the terminal BT3 has only one (yellow) socket.

It is available either with operating key or with RFID system for transponder chip.

Connection cables
All doors are easily connected to the central controller RJ by flat cables with RJ45 connectors. The cables and their corresponding sockets are clearly marked by different colours (green, yellow, blue).

Central power pack
The 24 VDC power supply of the terminals and the locking devices is provided by a central power pack. It is available either with 2.7 A or 5 A power. The power pack is furnished ready for mounting with a mains cable with safety plug and a 2 m long 24 VDC cable with 6-pin connector to the central controller RJ of the installation, i.e. it doesn’t have to be opened for connection.

Locking devices
For locking the doors is available a large choice of bar magnets and electric strikes (see page 08.047.00 and the following). It is essential that the used locking devices dispose of a potential-free feedback contact.

Additional components
- Emergency exit terminal according to EltvTR (see page 08.043.00)
- Time control unit (see page 08.044.00)
Centrally Controlled System -
Central Controller RJ

The central controller RJ is the core of the central interlock control system. All control boards are placed in the central controller RJ contrary to the peripheral system where they are located in the respective control terminals. The standard version provides 2 control boards for 2 doors. In case the interlock control system consists of more doors, the central controller RJ will contain the necessary number of control boards.

The main advantage of the central interlock control system is it requires even less connection cables to the doors and all relations can be adjusted in the central controller RJ.

Structure

The central interlock control system has been designed for systems with up to 5 doors. If necessary, it can be used for up to 8 doors.

The central controller RJ consists of a basic circuit board on which are plugged the control boards of the different doors. Above each control board are 2 sockets:
- green socket for green connection cable to the operating terminal BTZ on the door.
- blue socket for the connection cable to the locking device of this door.

The power cable of the power pack is plugged in the 2-pin socket down in the right corner.

Options

Beside the basic functions several additional options can be achieved. The most important ones are listed below, with the necessary accessories.

- **Global emergency-open GNA**
  In case all doors of the interlock system should open once the emergency-open switch on one of the operating terminals has been pressed (global emergency-open), this can easily be achieved - also later - by adding a relay (part no. 710953) to the central controller RJ. This relay is simply plugged in the provided socket.

- **LAN module**
  It is possible to transmit status information and errors from the central controller RJ to a facility management system. For this purpose the central controller RJ can be upgraded in production with an additional circuit board (part no. 710954). This allows the facility management system e.g. to trigger an alarm, to pass an information to the ventilation system etc.

The LAN module is not included in the standard version!

- **Achieving special functions as e.g. the discretion circuit**
  For this purpose an 8-pin screw-type terminal is provided in the central controller RJ.

- **Time-delayed opening**
  In case it should be possible to reopen some doors only with a time delay, this can be adjusted by a jumper on the respective control board.

- **Integration of door operators**
  It is also possible to integrate door operators on (some) doors of the interlock system. In this case the terminals on the respective doors have to be without emergency-open and for the operator a separate emergency-open switch has to be mounted.
Central Interlock Control System -
Central Controller RJ - continuation

For systems with up to 8 doors the central controller RJ can be upgraded in several ways:
- Connection of another central controller RJ: max. 8 doors.
- Connection of a distribution box of the peripheral system. This also allows to control 8 doors in total.
- Direct connection of a control terminal of the peripheral system. This enlarges the system by 1 door to a total of 6 doors.

Dimensions

The strain relief of the incoming and outgoing cables is achieved by fixing the cables with tie wraps to the two cable support brackets. The cable inlets are sealed dust proof by cellular material.

For fixing 4 borings of Ø 5.4 mm are provided in the casing of the central controller RJ.

Central Interlock Control System - Operating Terminal BTZ

For the DICTATOR central interlock control system only simple operating terminals are mounted on the doors.

The operating terminal BTZ is connected by a flat cable with RJ45 connectors (green) directly to the central controller RJ. Usually on the rear side of the door an operating terminal BT3 (also used for the peripheral system) is connected to the operating terminal BTZ. The only difference between the two terminals is, that the BTZ has two sockets for flat cable (one for the cable from the central controller RJ and one for the cable to the operating terminal BT3).

### Dimensions

The DICTATOR terminals meet the requirements of clean rooms. The operating terminal BTZ is available with and without emergency-open switch.

For unlocking the operating terminal it is furnished either with a piezo-type key (stainless steel) or with the RFID system for transponder.

The operating terminal BTZ can directly be connected to an access control (integrated in the terminal with RFID system) or a large surface switch, for example.

The flat cable (green) for the connection to the central controller RJ is available in 4 different lengths: 3, 5, 10, 15 m (for part numbers see page 08.026.00).

### Technical Data

- **Power consumption**
  - With emergency-open: max. 30 mA
  - Without emergency-open: max. 15 mA
- **IP rating**: IP 20* (operating key/emergency-open: IP 65)
- **Operating temperature**: -10 °C to +40 °C
- **Operation**: piezo-type key with red/green circle illumination or transponder in case of RFID system
- **Emergency-open switch**: mushroom-type push-to-lock, illuminated
- **Emergency-open contact set (capacity)**: 1 make contact (NO): 500 mA
- **Material front plate**: AISI 304

*IP rating when not built in. The final IP rating depends on the mounting situation.
Central Interlock Control System - Operating Terminal BT3

Normally the doors of an interlock system are used from both sides. Therefore, the additional operating terminal BT3, connected to the operating terminal BTZ, is required on the other side of the door.

The operating terminal BT3 is available with and without emergency-open switch.

The front plates of all terminals have been designed for their mounting in hollow profiles. On demand, there are available front plates with differing measurements and with the customer's logo.

The operating terminal BT3 is connected to the operating terminal BTZ by the connection cable with RJ45 connector (marked yellow). The cable has to be ordered separately. By default two lengths are available:
- 250 mm (part no. 710936)
- 1000 mm (part no. 710937).

The operating terminal BT3 can directly be connected to an access control (integrated in the terminal with RFID system) or e.g. a large surface switch.

Central Interlock Control System - Connection Cables

The components of the central interlock control system are connected by simple flat cables with colour marked RJ45 connectors. This significantly reduces the mounting costs and the danger of errors when connecting the single components.

Connection Cables

Connection cable central controller RJ - operating terminal BTZ (1)
The connection cable between central controller RJ and the operating terminals BTZ on the respective doors is a flat cable with RJ45 connectors on both ends. The connectors as well as the corresponding sockets are marked green.
Standard lengths: 3 m, 5 m, 10 m and 15 m

Connection cable operating terminals BTZ - BT3 (2)
The connection cable between the operating terminals BTZ and BT3 is also a flat cable with RJ45 connectors on both ends. The connectors as well as the corresponding sockets are marked yellow.
Available lengths: 250 mm and 1 m

Connection cable for door locking device or door operator (3)
As the DICTATOR interlock control system can be combined with a multitude of locking devices the connection cable for the locking device or door operator is furnished only on one end with a RJ45 connector (blue colour). This is plugged in the central controller RJ. On the other end of the cable are 4 free leads which are marked explicitly (2 leads for the feedback contact and 2 leads for the power supply).
Standard lengths: 250 mm, 2 m, 4 m and 15 m

Power cable (4)
The standard version of the central interlock control system does not require power cables to the door terminals. The power pack is provided with a 2 m long, pluggable power cable which has just to be plugged in the corresponding socket of the central controller.

Connecting a second central controller RJ
If a central system is upgraded by a second central controller RJ, two cables are needed to connect the two central controllers RJ:
- control cable red
- 6 core power cable
Details about these two types of cables are to be found on page 08.017.00.

Connecting a distribution box VK3 of the peripheral system
For controlling 8 doors also two cables are needed to connect the distribution box:
- control cable red
- 6 core power cable
Details about these two types of cables are to be found on page 08.017.00.

Connecting external components
Additional components as access controls or large surface switches have to be connected to the interlock control system by the customer. The operating terminals BTZ and BT3 dispose for their connection of a pluggable 3-pin screw terminal.

(see page 08.025.00)
Ex-Proof Interlock Control System - Overview

The interlock control system for hazardous areas functions similar to the system with central controller. The control boards of all doors belonging to the interlock system are united in a casing. Whenever it is possible the central controller should be mounted outside the hazardous area. However, it also can be placed, together with the power pack, in an ex-proof casing and then be mounted within the hazardous area.

The ex-proof interlock control system allows to control a maximum of 5 doors in the hazardous area. But it is possible to extend the ex-proof interlock control system to up to 8 doors.

Basic Set-up

In the ex-proof interlock control system all feeding lines from the terminals and locking devices of the doors are directly led to the EX central controller and connected there. In hazardous areas flat cables and RJ45 connectors cannot be used.

On the doors is mounted the ex-proof operating terminal BTZ EX. Contrary to most ex-proof operating devices it is as small and aesthetically attractive as the terminals of the other DICTATOR interlock control system types. There are available two versions of the terminal BTZ EX. It always has an operating key to request the opening of the door and a LED light to indicate the status of the door. The light is either green or red, same as the illuminated ring of the door terminals of the other interlock control systems. On both sides of the door the same type of terminal is mounted. Both are directly connected to the EX central controller. In addition the operating terminal can also be equipped with an emergency-open switch.

As locking device is used an ex-proof DICTATOR electromagnet with separate feedback contact. Magnet and feedback contact are also directly connected to the SK central controller of the ex-proof interlock control system.

The power pack which is ready for plug-in supplies the power. Its safety plug is plugged in a socket on site. In the SK central controller is provided a socket for the power cable of the power pack.

**Legend:**
- BTZ EX = ex-proof operating terminal
- EM GD EX = ex-proof electromagnet

System Components

Ex-Proof Interlock Control System - Components

The ex-proof DICTATOR interlock control system consists of a few main components. Its structure is very simple. The system is also characterised by the extremely simple programming and the attractive, small terminals.

The standard version of the SK central controller and the corresponding power pack are intended for their mounting outside the hazardous area. In case that is not possible, both components can be mounted in an ex-proof casing.

**SK Central controller**

There is needed one SK central controller per system. The controller itself is not ex-proof (see above). Usually it can control up to 5 doors. But it is possible to enlarge the system. The following options exist:

- Connection of a second SK central controller. This allows to control 8 doors in the hazardous area.
- Connection of a distribution box of the peripheral interlock control system (see page 08.015.00). This allows to control in total 8 doors: 5 doors from the SK central controller and from the distribution box of the peripheral system 3 more doors which need a control terminal of the peripheral system and if necessary an operating terminal BT3 - see page 08.013.00 et sq.). These 3 doors, however, have to be located outside the hazardous area.
- Direct connection of a control terminal of the peripheral system (see page 08.013.00). This adds 1 door to a total of 6 doors. But also with this version the additional door has to be located outside the hazardous area.

To the SK central controller also doors outside the hazardous area can be connected (see information on peripheral and central interlock control system). But as the cables have to be connected in the SK central controller and cannot be plugged in there is needed an adaptor for the connection of flat cables with RJ45 connector.

**Operating terminal BTZ EX**

On every door in the hazardous area an operating terminal BTZ EX has to be fitted. The operating terminal is provided with the corresponding connection cables to the EX central controller.

**Central power pack**

The 24 VDC power supply of the SK central controller is provided by a power pack. It is available either with a power of 2.7 A or 5 A. The power pack is furnished ready for mounting with a mains cable with safety plug and a 2 m long 24 VDC cable with 6-pin connector to the SK central controller, i.e. it doesn’t have to be opened for connection. The power pack is not ex-proof.

**Door locking device**

In the hazardous area an ex-proof electromagnet is used to lock the doors. Information about the magnet can be found beginning on page 08.032.00. In addition there is required a separate ex-proof feedback contact on the doors.

**Time-delayed opening**

In the SK central controller it can be adjusted that certain doors of the interlock system are released only after a delay. The remaining time, however, is not indicated in the interlock.

Information about more components for doors outside the hazardous area can be found on the pages about the peripheral resp. central interlock control system.
Ex-Proof Interlock Control System - SK Central Controller

In the ex-proof interlock control system all electrically relevant parts are combined in the SK central controller. The operating terminals are connected by screw terminals as hazardous areas require special cables and the flat cables of the not ex-proof version cannot be used. Apart from that the SK central controller corresponds mostly to the central controller RJ.

The standard version contains 2 control boards for 2 doors. In case the interlock system consists of more doors, the SK central controller will be provided with the corresponding number of control boards.

Structure

The SK central controller has been designed for systems with a maximum of 5 doors. But in case of need, with a second SK central controller you can control in total 8 doors in a hazardous area.

The SK central controller contains a basic circuit board on which is attached a control board for every door. Above each control board are 3 terminal strips:
- KL 1 to connect the ex-proof electromagnet and the separate feedback contact,
- KL 6 to connect the luminous diode of the terminal,
- KL 11 to connect the Emergency-Open switch (of the operating terminal or a separate emergency-open switch)

The connection cable from the power pack is plugged in the 2 pin socket down in the right corner.

Options

Beside the basic functions a number of additional options are possible. Below are listed the most important ones with the necessary accessories.

- **LAN module**
  It is possible to transmit status information and errors from the SK central controller to a facility management system. For this purpose the SK central controller can be upgraded in production with an additional circuit board (part no. 710954). This allows e.g. the facility management system to trigger an alarm, to pass an information to the ventilation system etc.

  The LAN module is not included in the standard version!

- **Achieving special functions as e.g. the discretion circuit**
  For this purpose an 8-pin screw-type terminal is provided in the SK central controller.

- **Time-delayed opening**
  In case it should be possible to reopen some doors only with a time delay, this can be adjusted by a jumper on the respective control boards.

- **Integration of door operators**
  It is also possible to integrate door operators on (some) doors of the interlock system. In this case the terminals on the respective doors have to be without emergency-open and a separate emergency-open switch has to be mounted for the operator (e.g. ex-proof push-to-lock switch, part no. 700254, page 04.067.00).
Ex-Proof Interlock Control System - SK Central Controller - continuation

For systems with up to 8 doors the SK central controller can be upgraded in several ways:
- Connection of another SK central controller: max. 8 doors in hazardous area.
- Connection of a central controller RJ: up to 8 doors in total, max. 5 doors in hazardous area, rest outside hazardous area.
- Connection of a distribution box of the peripheral system: up to 8 doors in total, max. 5 doors in hazardous area.
- Direct connection of a control terminal of the peripheral system. This way the system can be enlarged by 1 door to a total of 6 doors, max. 5 doors in hazardous area.

Components of the peripheral system can be connected by using the adaptor with the part number 710964.

The strain relief of the incoming and outgoing cables is achieved by fixing the cables with tie wraps to the two cable support brackets. The cable inlets are sealed dust proof by cellular material.

To fix the SK central controller 4 borings of Ø 5.4 mm are provided in the casing.

If the SK central controller has to be mounted within the hazardous area, it is fitted together with the power pack into an ex-proof casing of the ex-protection type Ex II 2G Ex de IIC T6. The dimensions and the exact model depend on the number of doors the ex-proof interlock control system consists of.

Ex-Proof Interlock Control System - Operating Terminal BTZ EX

A special feature of the ex-proof interlock control system are the operating terminals on the doors. They are as small, unobtrusive, elegant and suitable for clean rooms as the terminals of the "normal" DICTATOR interlock control systems.

With the ex-proof terminals a separate luminous display indicates the status of the door. Depending on the status it shows a green or red light.

The terminals are furnished with cables for their connection to the SK central controller. When ordering the terminals please consider the required length of cable (5, 10 or 15 m).

Ex-Proof Interlock Control System - Ex-Proof Electromagnet

As locking device is mounted the tested and approved ex-proof electromagnet DICTATOR EM GD 70 with a holding force of 1450 N. If in case of special applications the holding force should not be sufficient, several electromagnets can be used.

The electromagnet comes with a cable that is connected to the SK central controller. Depending on the distance, cables of 5, 10 and 15 m length are available.

The electromagnet is registered at the PTB (German national metrology institute providing scientific and technical services) under the type-examination certificate PTB 03 ATEX 2174 X and the information of being conform with the PTB design 03 ATEX N060.

To accomplish the mounting every magnet needs a potential equalisation. On the mounting plates is provided a connection for connecting an equipotential bonding conductor (to be provided on site).

For safety reasons every magnet must have a superposed fuse, max. 3 x Iₕ according to IEC 60127-2-1, as protection against a short circuit. One fuse per door is already included in the SK central controller.

The ex-proof electromagnet EM GD 70 does not have an integrated feedback contact. This has to be mounted separately.

</table>
The electromagnet requires a counter plate. It has to be ordered separately. Depending on the mounting possibilities of magnet and counter plate different types of counter plates are available. They differ in respect of height (distance between mounting plate and counter plate), angle of inclination and type of suspension. The most used model is the flexible counter plate, part no. 040026.

Counter Plates for Ex-Proof Electromagnet

Flexible counter plate
AP GD 70 G20
part no. 040026

Counter plate with angular joint
AP GD 70 W54
part no. 040068

Telescopic counter plate
AP GD 70 T84
part no. 040029
**Mounting Kit**

For an easy mounting of the ex-proof magnet and the counter plate on the front side of the door (where the hinges are visible) a mounting kit (part no. 710962) is available. Once they are mounted, magnet and counter plate will be completely covered when the door is closed. This type of mounting is suitable for clean rooms.

There are also available two additional brackets (part no. 710963) which allow to integrate the ex-proof feedback contact (surface type, see next page).

The electromagnet EM GD 70 Ex 43m is fixed to the door frame directly above the door. For the flexible counter plate, part no. 040026, the corresponding mounting bracket of the mounting kit is fixed on the door. To this is screwed the fastening bracket for the counter plate and to this the counter plate. It has to be made sure that it completely covers the electromagnet. Then the covers are fixed.

The surface of the covers is powder-coated in white (RAL 9010).

Interlock Control System for Flush Fitted Switch Boxes or Pattresses SP - Overview

In areas which require an interlock control system but where the door terminals don't have to meet extremely high requirements regarding the suitability for clean rooms, the components of the door terminals can also be integrated in the switch series LS 990 of the company Jung.

Basic Set-up

The structure of the version for the switch boxes SP is similar to the one of the ex-proof interlock control system. All control boards are located in the central controller. The individual components of the "door terminals" and the locking devices as bar magnets or electric strikes are connected directly in the SK central controller.

The necessary wiring and the electrical connection have to be effected on site by the customer. This offers the highest possible flexibility of the system.

The power pack supplying the power is ready for plug-in. Its safety plug is plugged in a socket on site. In the SK central controller is provided a socket for the power cable of the power pack.

The operating key, the LED light for indicating the door status and, if necessary, the emergency-open switch are inserted in the switch box/pattress series LS 990 of the company Jung. Depending on the project single frames or frames for up to 5 switches can be used.

Legend:

FH = bar magnet or electric strike
BT = operating terminal, composed of variable components
Interlock Control System for Flush Fitted Switch Boxes or Pattresses SP - Components

If necessary, this interlock control system also allows to integrate components of the peripheral or central system. In this case a central controller RJ or a distribution box of the peripheral system are connected to the SK central controller.

System Components

SK Central controller
Per system one SK central controller is needed. It is intended for the connection of cables provided on site.

Usually it can control up to 5 doors. However, it is possible to enlarge the system to a maximum of 8 doors by connecting another SK central controller.

In addition it is also possible to integrate in the interlock control system for switch boxes SP components of the peripheral system. In this case a distribution box of the peripheral system (see pages 08.015.00 et sq.) is connected which allows to control 3 more doors with each a control terminal of the peripheral system and if required an operating terminal BT3 - see pages 08.013.00 et sq.). Another option is to connect a pluggable central controller RJ (see pages 08.021.00 et sqq.) together with the operating terminals BTZ and BT3.

Operating terminals
They are individually combined per door. Components are the Jung switch series LS 990, a switch for releasing the door, an emergency-open switch on a yellow faceplate and a light sign fitted in a faceplate.

Central power pack
The 24 VDC power supply of the SK central controller is provided by a power pack. It is available either with a power of 2.7 A or 5 A. The power pack is furnished ready for mounting with a mains cable with safety plug and a 2 m long 24 VDC cable with 6-pin connector to the SK central controller, i.e. it doesn’t have to be opened for connection.

Door locking device
For locking the door a great choice of bar magnets and electric strikes is available (see catalogue beginning on page 08.047.00). It is important that the locking devices used have a potential-free feedback contact.

Time-delayed opening
In case certain doors of the interlock system shall be released only after a delay, this can be adjusted directly in the SK central controller. The remaining time, however, is not indicated in the interlock.

Information about more components can be found on the pages about the peripheral and the central system and the additional components.

It is also possible to connect components of other manufacturers (e.g. emergency exit terminals and electric strikes). Connection diagrams can be found in the manual or are available on request.
Interlock Control System for Flush Fitted Switch Boxes or Pattresses SP - SK Central Controller

The interlock control system for flush fitted switch boxes SP combines all electrically relevant parts in the SK central controller. The operating terminals are connected by screw terminals.

The standard version provides 2 control boards for 2 doors. In case the interlock control system consists of more doors, the SK central controller will be furnished with the necessary number of control boards.

Structure

The SK central controller is designed for systems with maximum 5 doors. If necessary, the system can be enlarged to maximum 8 doors by adding an additional SK central controller.

The SK central controller contains a basic circuit board on which are plugged the control boards for the individual doors. Above every control board are situated 3 terminal strips each:
- KL 1: connection of the locking device (bar magnet or electric strike)
- KL 6: connection of the operating keys and the light signs of the corresponding terminals
- KL 11: connection of the emergency-open switch

More information about the structure, functions and additional options can be found beginning on page 08.029.00.

Interlock Control System for Flush Fitted Switch Boxes SP - Components "Operating Terminals"

The operating terminals of the system for switch boxes SP are combined individually and assembled on site. This offers the highest possible flexibility. The SP system is intended for mounting into flush-mounted boxes.

The flush switch boxes should have a diameter of Ø 60 mm and a depth of 40 - 45 mm.

Components

For the operating terminals the following components are available:

- **Frames of the Jung switch series LS 990** (colour alpine white)
  Depending on the number of elements of the operating terminal (with/without emergency-open switch), usually the double or triple frame will be used. To prevent misuse, it is however also possible to locate e.g. the emergency-open switch separately from the normal operating terminal in a single frame.

- **Insert Emergency-Open Switch**
  To make the emergency-open switch contrast optically, it is furnished with a yellow faceplate. The emergency-open switch is illuminated. It can be secured against misuse by a cover which is prepared for a lead seal (see page 08.045.00).

- **Faceplate** (colour alpine white) **with light sign green/red**
  The light sign is inserted in a faceplate with a corresponding hole. Depending on the situation, whether the door may be opened or whether another opened door prevents its opening, the light is green or red.

- **Switch for opening the door**
  The rocker of the switch shows an icon "open door" and the DICTATOR Logo.

- The wiring and connection of all components has to be provided on site.

### SK Central Controller

(see page 08.039.00)
Interlock Control System
for Flush Fitted Switch Boxes SP
Interlock Control System - Emergency Exit Terminal

The DICTATOR interlock control system provides a terminal designed especially for doors in emergency exits. These doors are equipped both with the normal control terminal and an additional emergency exit terminal. This terminal only serves for unlocking the door during an emergency. Normally the interlock system door is operated by the control terminal (without emergency-open switch).

The emergency exit terminal has been tested by the German TÜV Thüringen and is approved for its use on emergency exit doors (German standard for electrical locking systems on emergency exits ElTVTR), certificate no. P-3250/08.

Dimensions

Functioning

The emergency-open switch of the emergency exit terminal permits to unlock the door of the interlock system in case of an emergency. The used locking device has to be an approved one (see DICTATOR bar magnets starting on page 08.047.00, approved magnets are marked with * or electric strikes on pages 08.064.00 and following). The power supply of the connected bar magnet is interrupted and the door unlocked.

The emergency exit terminal is provided with contacts for an external signal (siren, lamp, horn), even supplying a power of up to max. 1.4 A for the signal. (ATTENTION: this power consumption has to be taken into account when calculating the required performance of the power pack).

The emergency-open command can also be given directly by a facility management centre. The door status is indicated by the two lamps on the terminal:
- Red LED on: Door is locked electrically.
- Green LED on: Door is released.

After an emergency unlocking the door has to be locked again by a separate switching device within splitting distance of the door like for instance the loose-key switch with stainless steel front plate (AISI 304), part no. 710960 (see illustration on top and left). The half profile cylinder has to be provided by the customer.

Page 08.043.00
Interlock Control System - Time Control Unit

Some interlock systems require that some doors open only after a certain time delay, e.g. if the quality/temperature of the air in the interlock must reach a certain level before the door to the clean room may open. The DICTATOR time control unit permits the locking of max. 6 clean room doors against up to 6 "blackroom" doors. If one or several of the "blackroom" doors are opened during the locking time, the time control unit starts the count-down again. Only when the adjusted time has elapsed, the door to the clean room can be opened.

Functioning / Dimensions

The type of door (clean room or blackroom) is determined by the connection of the control terminals to different terminal strips of the time control unit.

The required period (16 different values possible) is adjusted in the time control unit with the help of 4 DIP switches. If a time different from the 16 adjusted periods is required, this has to be indicated in the order as it has to be programmed in production.

The time control unit has a 7-segment display and an additional dot. If the time control unit is on, the dot of the display lights up. When the time control unit is activated by one of the connected terminals, the dot starts flashing (one flash per second). When all blackroom doors are closed the countdown starts. The time control unit divides the adjusted period in 10 intervals and the display counts down from 9 to 0, thus indicating the remaining time during which the doors stay locked.

Models / Components

It is possible to connect up to 6 additional displays (part no. 710805) to the time control unit. Independant of the amount of additional displays there is always required one extender circuit module (part no. 710808). The time control unit is connected with a normal cable to the distribution box. For the connection of the additional displays and the extender circuit module the connection cables, part no. 710809 or 710810, are to be used. If their length is not sufficient, the connection has to be done on site. In this case a set of connection plugs, part no. 710811, is required, one for each additional display.

Flush and Surface Boxes

For the installation of the different terminals there are available suitable flush and surface boxes. Furthermore, the terminals with emergency-open switch can be protected against unauthorised activating of this switch by a cover that is prepared for a lead seal.

Interlock Control System - Installation Components

Generally the control and operating terminals and also the time control unit are intended for flush mounting in the hollow profiles of the interlock doors. If necessary, a corresponding flush box is available (part no. 710829).

But the terminals can also be mounted on the surface. The surface box has the IP rating IP 65 and is powder-coated. It is available in two colours:
- white RAL 9010 (part no. 710831)
- white aluminium, metallic, RAL 9006 (part no. 710832).

Also for the emergency exit terminal a flush box (part no. 710834) and a surface box in white RAL 9010 (part no. 710835) are available.

Cover Prepared for a Lead Seal

In case the emergency-open switches in an interlock control system are again and again misused, they can be protected by a cover that is prepared for a lead seal (part no. 710839). This cover can be retrofitted and is from transparent, UV resistant plastics with a yellow collar for fixing.

This cover has a predetermined separation area and can be reused after the emergency-open switch has been activated.

The lead seal is not included in the delivery.
Interlock Control System
Additional Components

Additional Components for Peripheral and Central Interlock Control System - Order Information

On this page you will find the part numbers of all the additional components for the peripheral and central DICTATOR interlock control system mentioned on the previous pages.

Order Information
